## Pharmacology by Mahmoud Nazih

Nazih Table: Lecture 4 - Pharmacokinetics I (Absorption & Distribution)

Section	Key Points/Details	Examples/Notes	Important Questions
Definition	- Pharmacokinetics: What the body does to	Nazihiat: "K for Kinetics =	Q1: What does pharmacokinetics
	the drug (ADME: Absorption, Distribution,	Body to Drug", "	mean?
	Metabolism, Excretion).	D for Dynamics = Drug to	A: What the body does to the drug.
	- Pharmacodynamics: What the drug does to	Body."	
	the body.		
Routes of	- Enteral: Oral, sublingual, rectal.	Examples:	Q9: Which route has 100%
Administration	- Parenteral: IV, IM, subcutaneous.	- Oral: Common but subject	bioavailability?
	- Others: Inhalational, topical, transdermal.	to first-pass effect.	A: Intravenous.
Ovel	Nact duyes shoulded in the small intesting	- IV: 100% bioavailability.	010. \\/\beta/bat bat dassuibas duus
Oral Absorption	- Most drugs absorbed in the small intestine (large surface area, long residence time).	- <b>Weak acids:</b> Absorbed in stomach (low pH).	<b>Q10:</b> What best describes drug absorption?
Absorption	- Subject to first-pass metabolism in liver.	- <b>Weak bases:</b> Absorbed in	A: Weak acidic drugs are non-
	- Subject to inst-pass metabolism in liver.	intestine (higher pH).	ionized in the stomach.
First-Pass	- Orally administered drugs metabolized by	Example:	<b>Q5:</b> What is the first-pass effect?
Effect	intestinal and hepatic enzymes <b>before</b>	- High first-pass effect:	A: Drug is metabolized by intestinal
2.1000	entering systemic circulation.	Propranolol.	and hepatic enzymes before
	- Reduces bioavailability.		circulation.
Bioavailability	- Fraction of administered drug reaching	IV administration: 100%	Q8: What is bioavailability?
·	systemic circulation unchanged.	bioavailability.	A: The proportion of the drug that
	- Influenced by absorption and first-pass	Oral drugs: Reduced	reaches systemic circulation.
	metabolism.	bioavailability.	
Mechanisms	- Passive Diffusion: Driven by concentration	Examples:	Q7: What is true about facilitated
of Absorption	gradient, no energy required.	- Passive: Lipid-soluble	diffusion?
	- Facilitated Diffusion: Passive but uses	drugs.	A: Does not require energy.
	carriers, no energy.	- Facilitated: Vitamin B12.	
	- Active Transport: Against gradient, requires	- Active: Glucose.	
	energy.		
	- Endocytosis: Bulk transport.		22 111111111111111111111111111111111111
Factors	- Physicochemical Properties: Solubility, pKa,	Nazihiat: "SALT-BF"	Q3: Which best describes
Affecting	lipid solubility.	(Solubility, Area, Lipid	pharmacokinetics properties?
Absorption	<ul><li>- Surface Area: Higher in small intestine.</li><li>- Blood Flow: Enhances absorption.</li></ul>	solubility, Transport, Blood	<b>A:</b> Most orally administered drugs are absorbed in the small intestine.
	- <b>Food</b> : May delay or reduce absorption.	Flow, Food).	are absorbed in the small intestine.
Blood-Brain	- Restricts polar/ionized drugs.	Mnemonic: "LLC" (Lipid-	Q4: What is true about the BBB?
Barrier (BBB)	- Lipid-soluble, unionized drugs can cross BBB.	soluble, Low-ionized Cross).	A: Highly lipid-soluble drugs readily
5ac. (555)	- Example: Thiopental crosses BBB for rapid	3014310, 2011 10111204 01033).	cross the BBB.
	anesthesia induction.		
Drug	- Volume of Distribution (Vd): Apparent	Examples:	Mnemonic: "Vd = Volume Delivers."
Distribution	volume required to contain drug at plasma	- Low Vd: Heparin (4L).	
	concentration.	- High Vd: Amiodarone	
	- Factors Affecting Distribution: Lipid	(4200L).	
	solubility, protein binding, blood flow.		
Key Graph	- Ionized vs. Non-Ionized:	Nazihiat: "Unionized =	Q6: What describes a
Concepts	Non-ionized drugs are lipid-soluble and cross	Universal Entry."	pharmacokinetic property?
	membranes.		A: Orally administered drugs are
	- Henderson-Hasselbalch Equation:		absorbed in the small intestine.
	Determines ionization at a given pH.

## Pharmacology by Mahmoud Nazih

## **Summary Table: Routes of Drug Administration**

Route	Features	Advantages	Disadvantages
Oral (Enteral)	<ul> <li>Most common, convenient, and non-invasive.</li> <li>Absorbed in the GI tract (mainly small intestine).</li> <li>Subject to first-pass metabolism in the liver.</li> </ul>	<ul><li>Easy and safe.</li><li>Suitable for self-administration.</li><li>Cost-effective.</li></ul>	<ul> <li>Variable absorption.</li> <li>Not suitable for unconscious or vomiting patients.</li> <li>First-pass metabolism reduces bioavailability.</li> </ul>
Sublingual	<ul><li>Absorbed through capillaries under the tongue.</li><li>Bypasses the GI tract and liver.</li></ul>	<ul><li>Rapid absorption.</li><li>Avoids first-pass metabolism.</li></ul>	<ul> <li>Limited to small, lipophilic drugs.</li> <li>May cause irritation under the tongue.</li> </ul>
Rectal (Enteral)	<ul><li>Absorbed via rectal mucosa.</li><li>Partial avoidance of first-pass metabolism.</li></ul>	- Useful for patients who cannot swallow.  - Partially bypasses first-pass metabolism.	<ul><li>Inconsistent absorption.</li><li>May be uncomfortable for patients.</li></ul>
Intravenous (IV)	<ul><li>Drug directly injected into the bloodstream.</li><li>100% bioavailability.</li><li>Rapid onset of action.</li></ul>	<ul><li>Immediate effect.</li><li>Suitable for emergencies.</li><li>Precise dosing.</li></ul>	<ul><li>Irreversible.</li><li>Requires trained personnel.</li><li>Risk of infection.</li></ul>
Intramuscular (IM)	<ul> <li>Drug injected into the muscle.</li> <li>Absorption depends on blood flow to the injection site.</li> </ul>	<ul><li>- Allows depot (slow-release)</li><li>formulations.</li><li>- Useful for moderate-volume drugs.</li></ul>	<ul><li>- Painful.</li><li>- Absorption can vary depending on site and blood flow.</li></ul>
Subcutaneous (SC)	<ul><li>Drug injected under the skin.</li><li>Absorption slower than IV or IM.</li></ul>	<ul><li>Suitable for slow, steady drug release.</li><li>Can be self-administered (e.g., insulin).</li></ul>	<ul><li>Limited to small-volume drugs.</li><li>Risk of irritation or necrosis at the injection site.</li></ul>
Inhalational	<ul><li>Rapid absorption via the large surface area of respiratory mucosa.</li><li>Direct action on respiratory diseases.</li></ul>	<ul> <li>Fast onset of action (almost as quick as IV).</li> <li>Targeted delivery for respiratory diseases (e.g., asthma).</li> </ul>	<ul><li>Limited to specific drugs</li><li>(e.g., gases, aerosols).</li><li>Requires proper technique.</li></ul>
Topical	<ul><li>Applied directly to skin or mucosal surfaces.</li><li>Local action (e.g., creams, ointments).</li></ul>	<ul><li>Minimizes systemic side effects.</li><li>Direct action at the site of application.</li></ul>	- Limited to local effects Risk of skin irritation.
Transdermal	<ul><li>Drug delivered across the skin for systemic effect.</li><li>Uses patches.</li></ul>	<ul> <li>Sustained release.</li> <li>Avoids first-pass metabolism.</li> <li>Convenient for chronic conditions (e.g., nitroglycerin patches).</li> </ul>	<ul><li>- Limited to lipophilic drugs.</li><li>- Potential for skin irritation.</li></ul>
<u>Intra</u> thecal	<ul><li>Injected into cerebrospinal fluid (CSF).</li><li>Bypasses the blood-brain barrier (BBB).</li></ul>	- Direct access to the central nervous system (CNS).	<ul><li>Invasive.</li><li>Requires skilled personnel.</li><li>Risk of infection or nerve damage.</li></ul>

## **Nazihiat**

- Fast Routes: IV > Inhalational > Sublingual.
- Avoids First-Pass Metabolism: Sublingual, Rectal (partial), IV, Transdermal, Inhalational.
